Method

Add phase A into a glass beaker and mix until hydrated and uniform. Mix phase B in another glass beaker. Heat both A & B to (150oF/66oC) to melt/heat the ingredients. Mix phase C in a mortar and blend thoroughly, add then phase C to phase B and disperse. Add phase B/C to phase A and blend well until it is a homogenous cream. After the temperature has dropped to 90oF/32oC add phase D and stir again. At the end you still can change the shade by adding more titanium dioxide to make it lighter or adding more pigment blend to make it darker. Before adding one of these ingredients disperse them in 1/2 tsp. of triglyceride. Fill the fluid makeup into our tuba bottles or into a dispenser.

Properties

Makeup that is light and creamy can be applied evenly on the whole face or just where it's needed, for all skin types. It blends well and gives good coverage with a non-oily feel.
